## Homework Set 9 Solutions

(Distributed 11/9/16; Due on 11/9/16)
Read Chapter 12 in Zumdahl and complete the listed questions from the text: 12, 17, $26,34,39,46.59,65,68,78,82$; as well as the following problems:
A. Write the symbols for four ions that are isoelectronic with Xe .

$$
\mathrm{Te}^{2-}, \mathrm{I}^{-}, \mathrm{Cs}^{+}, \mathrm{Ba}^{2+}
$$

B. Indicate the direction of the polarity in each of the following bonds:

| $----\rightarrow$ | $----\rightarrow$ | --- |
| :---: | :---: | :---: |
| $\mathrm{C}-\mathrm{Cl}$ | $\mathrm{N}-\mathrm{O}$ | $\mathrm{H}-\mathrm{O}$ |

Which bond is expected to be the most polar? Why?
O-H is the most polar because the two atoms have the greatest difference in electronegativity
C. Draw Lewis dot structures for each of the following molecules:
(i) $\mathrm{SBr}_{2}$

Bent or tetrahedral, $105^{\circ}$

(iii) $\mathrm{NF}_{3}$
pyramidal or tetrahedral, $107^{\circ}$
(ii) $\mathrm{CO} \quad: \mathrm{C} \equiv \mathrm{O}$ :

Linear, $180^{\circ}$
(iv) $\mathrm{OCCl}_{2}$

(v) $\mathrm{CS}_{2} \quad \mathrm{~S}=\mathrm{C}=\mathrm{S}$

Linear, $180^{\circ}$
D. Indicate the expected shape and bond angles around the underlined atom for each of the molecules in part $C$

(b)

(c)
78. In $N F_{3}$, the central nitrogen atom has four pairs of electron pairs, but the boron atom in $\mathrm{BF}_{3}$ has only three pairs. The nonbonding electron pair on the N atom in $\mathrm{NF}_{3}$ pushes the fluorine atoms out of the plane of the nitrogen atom.
82. (a) tetrahedral
(b) pyramidal (c ) bent or V-shaped
